The Krka National Park is a common appearance in the surrounding area. Many amphibians can be found in the park area. Many plant species and subspecies have been recorded for its exceptional wealth of flora and fauna. To date, 860 plant species and subspecies have been recorded for its exceptional wealth of flora and fauna. To date, the park area is home to a rich variety of wildlife, including over 300 bird species, many of which are endemic to the region. The park is also home to a diverse range of reptiles and amphibians, including the rare Mediterranean wall lizard and the rare Balkan viper. The park is also home to a number of rare and endangered species, including the European otter, the Dalmatian pelican, and the Dalmatian crocodile.

Due to the distinctive position and various types of morphological forms, the park area is home to a rich variety of wildlife, including over 300 bird species, many of which are endemic to the region. The park is also home to a diverse range of reptiles and amphibians, including the rare Mediterranean wall lizard and the rare Balkan viper. The park is also home to a number of rare and endangered species, including the European otter, the Dalmatian pelican, and the Dalmatian crocodile.

The Krka River is exceptionally important for the biodiversity of the area. It provides a habitat for many endemic fish species, including the Krka trout and the Krka grayling. The river is also home to a variety of other species, including the European eel, the European eel, and the European salmon. The river is also an important breeding ground for a number of bird species, including the black tern, the little tern, and the red-breasted merganser. The river is also an important habitat for a number of other bird species, including the common kingfisher, the little egret, and the great cormorant.
